Hello,

The following submission has been created.

Track Name: Artificial Intelligence, Computing and Data-Driven Systems

Paper ID: 297

Paper Title: Smart Expense Tracker and Goal-Based Saving Analyzer

Abstract:
Managing personal finances requires more than recording purchases: people need to see where their money goes, check progress toward savings goals, and revise plans when income or expenses change. This paper presents the design of the Smart Expense Tracker and Goal-Based Saving Analyzer (SET-GBSA), a web-based tool that integrates transaction recording, category-wise analytics, goal tracking and explainable advice. Users record income and expenses, define a savings goal with a target amount and deadline, and monitor progress on a dashboard of bar, doughnut, line and progress charts. The system computes the monthly contribution needed to reach a goal and, when a contribution is missed, recalculates the requirement while checking it against the user's estimated surplus. A moving-average baseline forecasts short-term category expenses, and a rule-based module produces recommendations phrased as options rather than commands. The paper describes the architecture, data model, methodology, implementation design and a worked numerical example, and defines an evaluation framework covering functional correctness, forecast error, goal-plan accuracy and usability. No empirical results are claimed; the worked example is illustrative. SET-GBSA is intended as an educational aid to financial awareness, not as a substitute for professional financial advice.
