

GamersDen — A Smart Platform for Gamers and Gaming Centers

ABSTRACT

GamersDen is a full-stack web application designed to connect PlayStation gamers with nearby gaming centers and other players. The platform helps users discover PlayStation gaming centers based on their location, view available facilities, games, pricing, and booking slots. Gamers can create profiles, search and filter gaming centers, check real-time slot availability, and book gaming sessions conveniently. The system also provides a player-connection feature that allows users to find other gamers interested in the same games and organize multiplayer sessions. Gaming-center owners can register their centers, manage PlayStation consoles, games, prices, operating hours, and available slots through a dedicated dashboard. Users can also provide ratings and reviews based on their gaming experience. The frontend of GamersDen will be developed using React.js, JavaScript, CSS, and Bootstrap to provide a responsive and user-friendly interface. The backend will be developed using Django and Django REST Framework to handle authentication, user management, gaming centers, bookings, and player connections. MySQL or PostgreSQL can be used to store application data. The proposed system aims to simplify the process of finding gaming centers and connecting gamers while providing an efficient digital platform for gaming-center management.

Keywords: PlayStation Gaming, Location-Based Services, Player Matchmaking, Online Booking, Full-Stack Web Application.
